

10. Feature Requirements: Multiple Kids & Profiles

10.1. Overview & Strategy

To support families with twins, multiples, or closely spaced siblings, the app must evolve from a single-entity tracker to a multi-entity system.

Strategic Positioning: Rather than forcing parents to create entirely separate accounts (which breaks partner sync), we will use an in-app "Child Selector."

Monetization Tie-in: Multiple Kids is a Premium-only feature. The Free tier remains strictly limited to 1 child profile to keep onboarding simple for single-child families, while parents of multiples become highly motivated Premium subscribers due to their increased logistical needs.

10.2. Data Architecture Requirements

- Child ID: Every log entry (Feed, Sleep, Diaper, Growth) must be associated with a `child_id` in the database.
- Active State: The app must maintain an `active_child_id` in local state. All logging screens will silently pass this `active_child_id` when creating a new log.
- Legacy Data: For existing beta users, a default "Child 1" profile must be auto-generated, and all historical logs must be mapped to this `child_id` during the database migration to prevent data loss.

10.3. Core UI/UX Components

A. The Child Selector (Global Navigation)

- Placement: Horizontally scrollable "chips" or avatar circles located directly below the main app header, above the main timeline/action buttons.
- Behavior: Tapping a child's name/avatar instantly switches the dashboard timeline, "Last Logged" stats, and the target for all new logs to that specific child.
- Visual Indicators: Each child must be assigned a distinct, user-chosen color. The child's color should subtly tint their timeline cards or avatar to prevent parents from logging to the wrong baby.

B. Profile Management (Settings)

- Add Child: Located in Settings. Tapping this on a Free account triggers the Premium Paywall. Premium users can add up to 6 children.

- Child Details: Name, Date of Birth (for age-contextual insights), Photo/Avatar, and Assign Color.
- Archiving: Parents should be able to "Archive" a child who has outgrown the app, removing them from the main selector without deleting their historical data.

10.4. The "Twin/Multiple" Shortcut Features (Critical for UX)

Standard apps force parents to switch profiles back and forth to log identical events. We will introduce shortcuts specifically designed to reduce tapping for multiples.

- "Apply to All" Toggle:
 - On the Sleep and Diaper logging screens, include a toggle switch: [] Log for all children.
 - If toggled ON, the app creates duplicate log entries with the exact same timestamp, assigning one to each active, non-archived child.
- Tandem Feeding Logic (Breast):
 - When logging a breastfeeding session, the user should be able to select multiple children for a single timer.
 - Example UI: Checkboxes next to each child's name under the "Side" selection (e.g., [x] Baby A - Left, [x] Baby B - Right).
- Independent Bottle Feeds: Bottles should not use "Apply to All" by default, as twins rarely consume the exact same amount of ounces. Parents must log bottle feeds per child to maintain accurate intake insights.

10.5. Timeline & Insights Adjustments

- Filtered Timeline: The main home screen timeline must only show events for the `active_child_id`. Mixing siblings on one chronological list creates visual chaos.
- Combined View (Premium): Add a toggle in the Insights/Web App: "Side-by-Side Day View." This displays two parallel daily timelines (or overlaid sleep charts) so parents can compare schedules and identify if one baby is consistently waking the other.

11. User Stories: Multiple Kids

US-MK01: Switching Context (Premium)

As a parent of two, I want to quickly switch between my baby's profiles at the top of the screen, so that I can instantly see what the other baby did without navigating to a settings menu.

- Acceptance Criteria: Given I am a Premium user with 2 children, when I tap "Baby B's" name chip, the home screen timeline immediately updates to show only Baby B's logs, and the "Last Fed" widget updates to Baby B's data.

US-MK02: The Shared Nap Log (Premium)

As a parent of twins, I want to check a box to apply a single nap log to both babies at once, so that I don't have to log the same event twice when they sleep at the same time.

- Acceptance Criteria: Given I am logging a nap, when I check "Log for all children" and hit save, then a sleep log with the exact same start/end time is created for Baby A and Baby B, and both appear on their respective timelines.

US-MK03: Accurate Bottle Tracking (Premium)

As a parent of twins, I want bottle feeds to default to the currently selected baby only, so that I can accurately track that Baby A drank 4oz while Baby B drank 2oz.

- Acceptance Criteria: Given I am on the Bottle Feed logging screen, the "Log for all children" toggle must be hidden or disabled, ensuring intake data remains strictly tied to the active_child_id.

US-MK04: The Single-Child Paywall (Free User)

As a parent expecting a second child, I want to try to add a new profile, so that I can track both kids in one app.

- Acceptance Criteria: Given I am on the Free tier, when I go to Settings > Add Child, I am presented with the Premium paywall explaining that multi-child profiles, shared logging, and comparison insights require a Premium subscription.
